Practical No: 6

Decision Tree Classifier & Random Forest Classifier

AIM: Write a program to implement the Decision Tree Classifier & Random Forest Classifier with prediction, test score and confusion matrix.

Description:

Decision Tree Classifier:

Interpretability: Decision trees offer easy interpretability, aiding in understanding and explaining the logic behind classification decisions.

Overfitting: Decision trees can be prone to overfitting, especially if deep or complex, necessitating regularization techniques for optimal performance.

Random Forest Classifier:

Ensemble Learning: Random Forest is an ensemble method that combines multiple decision trees, enhancing model accuracy and stability.

Variance Reduction: Random Forest reduces variance by aggregating predictions from different trees, mitigating overfitting and improving generalization to new data.

Code with output

import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
from sklearn.preprocessing import LabelEncoder
from sklearn.model_selection import train_test_split
from sklearn.metrics import classification_report, accuracy_score, confusion_matrix
%matplotlib inline

df = pd.read_csv("WA_Fn-UseC_-HR-Employee-Attrition.csv")

Keeping emp position unaffected. df.head()

Exploratory Data Analysis sns.countplot(x='Attrition', data=df)

from pandas.core.arrays import categorical

Name: Ninad Karlekar Roll no.: 22306A1012

```
df.drop(['EmployeeCount', 'EmployeeNumber', 'Over18', 'StandardHours'], axis="columns",
inplace=True)
categorical col = []
for column in df.columns:
  if df[column].dtype == object:
     categorical_col.append(column)
df['Attrition'] = df['Attrition'].astype("category").cat.codes
for column in categorical_col:
  df[column] = LabelEncoder().fit_transform(df[column])
X = df.drop('Attrition', axis=1)
y = df['Attrition']
X train, X test, y train, y test = train test split(X, y, test size=0.3, random state=42)
def print_score(clf, X_train, y_train, X_test, y_test, train=True):
  if train:
     pred = clf.predict(X_train)

Analysis of Confusion Matrix

The model correctly identified 6 instances as positive.

It correctly identified 374 instances as negative.

However, it made 6 false positive predictions, indicating instances that were predicted as positive but were actually negative.

It also made 55 false negative predictions, indicating instances that were predicted as negative but were actually positive.
